In today's CC, create an express server with the following routes and its specification.

/

This is the home or root route. This route will return/send the number of times the website was visited.

Everytime someone visits the root route, you need to increase a counter.

In order to persist the amount of time this route was visited, write it into a text/json file as per your desire.

/reset

This route should reset the counter to 0 for the above route and return and HTML file with content "Reset successful" as h1 tag.
